

Apocalypse-

impossible? Think again!

2050, India-a young boy stares at the barren landscape of his hometown, where rising temperatures and water scarcity have made living life a burden. The Ganga river has dried up, the once snow capped peaks of the Himalayas are now dry and desolate, malaria is rampant and food quality is poor. He turns and asks his father "how did all this happen to our country"? He replies sadly "Our grandfathers and there grandfathers did this to us".

Text: Rishad Abraham

Imagine a world where temperatures regularly reach above 50 degrees Celsius, where New York, Venice, Mumbai and Hong Kong are under sea, a world where dengue is rampant in Sweden, where rice and wheat are scarce in India. A world where our descendants are struggling for basic necessities like food and water.

Impossible? I think not.
This is the world of climate change and its happening right now.

These changes in our environment are already taking place, and we are still ignoring them. If we wait till they hit us in the face, it may already be too late. Scientific research has shown that one of the countries worst affected by climate change is going to be India. They have predicted a 5 degree temperature rise every 50 years, as well as rising water levels. Drastic changes in our monsoon cycle and the greatest decrease of agricultural yield in one area since the black plague. Shocking? This is indeed the grim reality.
